

Inspiration Sites

AllRecipes

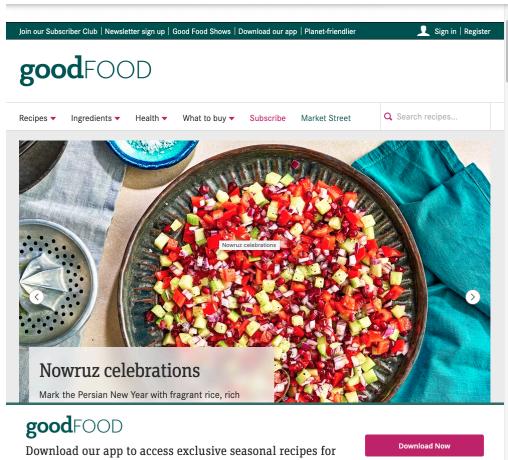

I like that they have a menu bar with different options, and I really like how they feature a recipe right on the homepage — it makes it feel alive and fresh.

Serious Eats

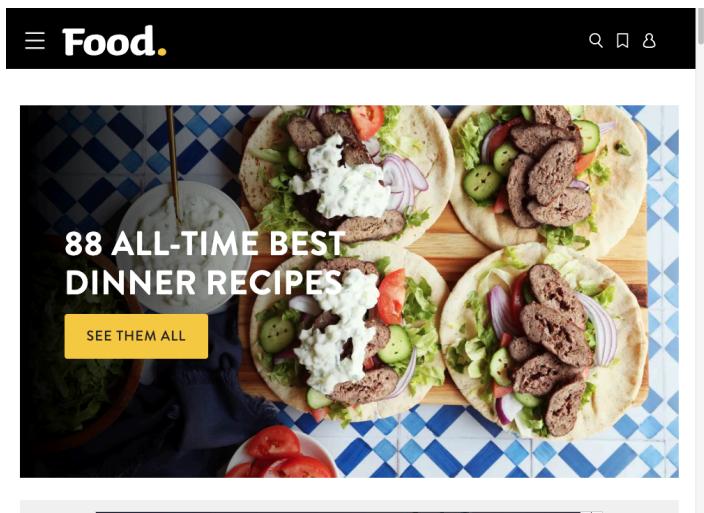

I like the way they lay out the recipes. The menu bar is easy to find, and the size of the recipe image is really bold and eye-catching.

BBC Good Food

I love how colorful this site is. The menu bar is clean and well-organized, and the overall vibe feels cheerful and inspiring.

Food.com

I like how simple and clean it looks. The images are large and inviting, and the whole site just feels easy to use.

These inspired how I styled my own recipe site — especially with the navigation bar, bigger images, and clean design.

Exercise 2.5: Django MVT Revisited Learning Goals

- Add images to the model and display them on the frontend of your application

- Create complex views with access to the model
- Display records with views and templates

Reflection Questions

- In your own words, explain Django static files and how Django handles them
 - Static files are the ones that I create — like CSS, images, and JavaScript — and they don't change. Django keeps them in a special folder and helps organize them so they can be used in templates.
- Look up the following two Django packages on Django's official documentation and/or other trusted sources. Write a brief description of each.

Package	Description
ListView	This view is used to show a list of items from the database, like all the recipes. In the background, Django uses <code>self.object_list</code> to hold all the items it's showing.
DetailView	This view shows just one object — like one specific recipe. Django uses <code>self.object</code> to refer to that one item while the view is running.

- You're now more than halfway through Achievement 2! Take a moment to reflect on your learning in the course so far. How is it going? What's something you're proud of so far?

I think it's going really well so far. I've learned a lot, especially about how Django connects the backend to the frontend using templates and views. I actually like working with Python and Django and they make a lot of sense to me.

I'm really proud of how my `recipe_app` is coming together. I've added images, styled the pages, and tested everything...and it's working! I've even been showing it off to my family because I'm so excited about how good it looks and how much progress I've made.
